

國立中山大學應用數學系 學術演講

講者：沈俊嚴 教授

國立中央大學數學系

題：Two weight T1 theory for singular integrals

時間：2015/10/01（星期四）

16:10 ~ 17:00 pm

地點：理學院四樓理 SC 4009-1 室

茶會：15:30~16:00 於理 SC 4010 室（系辦公室）

摘要

One of the central open problems in the area of nonhomogeneous Harmonic analysis is to find a real variable characterization for the boundedness of singular integrals in the setting of two arbitrary Borel measures. Not only the solution will be a profound extension of the famous T1 theorem of David and Journe in 1970s, but the solution will

have many important applications in various areas. In this talk, I will introduce the famous two weight problem and present our solution which settles the longstanding NTV conjecture for the Hilbert transform. If time permits, I will also outline our application of two weight Cauchy transform which settles a longstanding open problem in complex analysis.
