

Sample Solutions for Sample Questions 12.

1. Suppose $B = \{\vec{v}_1, \dots, \vec{v}_n\}$ and $D = \{\vec{u}_1, \dots, \vec{u}_m\}$.

Recall that

$$\text{Rep}_{B,D}(f) = \begin{pmatrix} & & & 1 \\ \text{Rep}_D f(\vec{v}_1) & \cdots & \text{Rep}_D f(\vec{v}_n) & | \\ & & & | \\ & & & \ddots \\ \left(\begin{array}{cccc} 1 & 0 & \cdots & 0 \\ 0 & 1 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 0 \end{array} \right) & & & 0 \end{pmatrix}$$

This means

$$f(\vec{v}_1) = \vec{u}_1, \dots, f(\vec{v}_r) = \vec{u}_r \quad \text{with } r = \text{rank}(f).$$

also $f(\vec{v}_{r+1}) = \dots = f(\vec{v}_n) = \vec{0}$.

Recall that $\text{nullity}(f) + \text{rank}(f) = n \Rightarrow \text{nullity}(f) = n - r$.

Naturally, pick $\{\vec{v}_{r+1}, \dots, \vec{v}_n\}$ as a basis of ~~nullspace(f)~~
nullspace(f).

Also, pick $\{\vec{v}_1, \dots, \vec{v}_r\}$ as a basis of nullspace(f) \perp

Next, let $\vec{u}_i = f(\vec{v}_i)$ for $i = 1 \sim r$. $\dim = n - (n - r) = r$

$\{\vec{u}_1, \dots, \vec{u}_r\}$ form an ~~space~~ independent set
and span a subspace U in W .

~~Take~~ Expand $\{\vec{u}_1, \dots, \vec{u}_r\}$ into a basis $\{\vec{u}_1, \dots, \vec{u}_m\}$
of W .

Then we are done.

2. Compute the char poly $p(x)$. $\rightarrow -x^3 + 2 + 3x$ $\rightarrow q(x) = x^2 + 1 + 2x$

$$\det \begin{pmatrix} -x & 1 & 1 & 1 \\ 1 & -x & 1 & 1 \\ 1 & 1 & -x & 1 \\ 1 & 1 & 1 & -x \end{pmatrix} = -x \cdot \det \begin{pmatrix} -x & 1 & 1 \\ 1 & -x & 1 \\ 1 & 1 & -x \end{pmatrix} - \det \begin{pmatrix} 1 & 1 & 1 \\ 1 & -x & 1 \\ 1 & 1 & -x \end{pmatrix}$$

$$+ \det \begin{pmatrix} 1 & -x & 1 \\ 1 & 1 & 1 \\ 1 & 1 & -x \end{pmatrix} - \det \begin{pmatrix} 1 & -x & 1 \\ 1 & 1 & -x \\ 1 & 1 & 1 \end{pmatrix}$$

$$= -2K(x^3 + 3x + 2) - 3q(x)$$

$$= -2K(x^3 + 3x + 2) - 3(x^2 + 2x + 1)$$

$$= +x(x+1)(\cancel{x^2 - x - 2}) - 3(x+1)^2$$

$$= \cancel{x}(x+1)^2 [x^2 - 2x \cancel{- 3}] = \cancel{x}(x+1)^3(x-3)$$

eigenvalues ~~= -1, -1, 3~~

$$\Rightarrow \lambda = -1, -1, -1, 3.$$

$$\textcircled{1} \quad \lambda = -1 \Rightarrow A + I = \begin{pmatrix} 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 \end{pmatrix} \rightsquigarrow \begin{pmatrix} 1 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}$$

$$\Rightarrow E_{-1} = \text{span} \left\{ \begin{pmatrix} -1 \\ 1 \\ 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 0 \\ 0 \\ 0 \end{pmatrix}, \begin{pmatrix} 1 \\ 0 \\ 0 \\ 0 \end{pmatrix} \right\} \quad (\text{geo multi} = 3, \text{good!})$$

$$\textcircled{2} \quad \lambda = 3, \quad A - 3I = \begin{pmatrix} -3 & 1 & 1 & 1 \\ 1 & -3 & 1 & 1 \\ 1 & 1 & -3 & 1 \\ 1 & 1 & 1 & -3 \end{pmatrix} \rightsquigarrow \begin{pmatrix} 0 & -8 & 4 & 4 \\ 1 & -3 & 1 & 1 \\ 0 & 4 & -4 & 0 \\ 0 & 4 & 0 & -4 \end{pmatrix}$$

$$E_3 = \text{span} \left\{ \begin{pmatrix} 1 \\ 1 \\ 1 \\ 1 \end{pmatrix} \right\}$$

$$\text{Let } D = \begin{pmatrix} -1 & -1 & -1 & -1 \\ -1 & -1 & -1 & -1 \\ -1 & -1 & -1 & -1 \\ 3 & 3 & 3 & 3 \end{pmatrix}, \quad Q = \begin{pmatrix} -1 & -1 & -1 & -1 \\ 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{pmatrix}$$

$$\text{Then } Q^{-1}AQ = D.$$

3. Compute char poly $P(x)$:

$$\det \begin{pmatrix} -x & 1 & 1 & 1 \\ 1 & -x & 1 & 1 \\ 1 & 1 & -x & 1 \\ 1 & 1 & 1 & -x \end{pmatrix} = -x \det \begin{pmatrix} -x & 1 & 0 & 1 \\ 1 & -x & 1 & 1 \\ 0 & 1 & -x & 1 \\ 1 & 1 & 1 & -x \end{pmatrix} - \det \begin{pmatrix} 1 & 1 & 0 & 1 \\ 0 & -x & 1 & 1 \\ 1 & 1 & -x & 1 \end{pmatrix}$$

$$- \det \begin{pmatrix} 1 & -x & 1 & 1 \\ 0 & 1 & -x & 1 \\ 1 & 0 & 1 & 1 \end{pmatrix} \rightarrow x^2$$

$$= -x(-x^3 + 2x) - 2x^2$$

$$= x^4 - 2x^2 - 2x^2 = x^4 - 4x^2 = x^2(x+2)(x-2).$$

$$\Rightarrow \lambda = 0, 0, \pm 2.$$

① $\lambda = 0$. $A - 0I = \begin{pmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{pmatrix} \rightsquigarrow \begin{pmatrix} 1 & 1 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}$

$$\Rightarrow E_0 = \text{span} \left\{ \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} \right\}.$$

② $\lambda = 2$, $A - 2I = \begin{pmatrix} -2 & 1 & 1 \\ 1 & -2 & 1 \\ 1 & 1 & -2 \end{pmatrix} \Rightarrow E_2 = \text{span} \left\{ \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix} \right\}$

③ $\lambda = -2$, $A + 2I = \begin{pmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \\ 1 & 1 & 2 \end{pmatrix} \Rightarrow E_{-2} = \text{span} \left\{ \begin{pmatrix} 1 \\ -1 \\ -1 \end{pmatrix} \right\}$

Let $D = \begin{pmatrix} 0 & & & \\ & 0 & & \\ & & 2 & \\ & & & -2 \end{pmatrix}$, $Q = \begin{pmatrix} -1 & 0 & 1 & 1 \\ 0 & -1 & 1 & -1 \\ 1 & 0 & 1 & -1 \\ 0 & 1 & 1 & -1 \end{pmatrix}$

Then $Q^{-1}AQ = D$.

4. Char poly $p(x) = \det(A - xI)$

$$= \det \begin{pmatrix} 2-x & 1 & 1 \\ 2-x & 1 & 1 \\ 1-x & 1-x & 1-x \end{pmatrix} = (x-2)^2(x-1)^2.$$

$$\Rightarrow \lambda = 1, 1, 2, 2.$$

① $\lambda = 1$. $A - I = \begin{pmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 0 & 0 & 0 \end{pmatrix}$

$$\Rightarrow E_1 = \text{span} \left\{ \begin{pmatrix} -1 \\ -1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix} \right\}$$

② $\lambda = 2$, $A - 2I = \begin{pmatrix} 0 & 1 & 1 \\ 0 & 1 & 1 \\ -1 & -1 & -1 \end{pmatrix} \rightarrow \begin{pmatrix} 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$

$$\Rightarrow E_2 = \text{span} \left\{ \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} \right\}$$

5. char poly $p(x) = \det(A - xI)$

$$= \det \begin{pmatrix} 2-x & 1 & 1 & 1 \\ 2-x & 1 & 1 & 1 \\ 1-x & 1 & 1 & 1 \\ 1-x & 1 & 1 & 1 \end{pmatrix} = (x-1)^2 (x-2)^2.$$

$$\Rightarrow \lambda = 1, 1, 2, 2.$$

$\oplus \lambda = 1 \quad A - I = \begin{pmatrix} 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 \\ 0 & 1 & 1 & 1 \\ 0 & 0 & 1 & 1 \end{pmatrix}$

$$\Rightarrow \underbrace{\dim E_1}_1 = 1 \quad \text{↑ only one free variable.}$$

$$1 = \text{geo multi} \neq \text{alg multi} = 2.$$

So A is not diagonalizable.

6. Let $A = \begin{pmatrix} 1 & 1 & & \\ & 1 & & \\ & & 2 & 0 & 1 \\ & & & 2 & 0 \\ & & & & 2 \end{pmatrix}$

$$\Rightarrow \text{char poly} = (x-1)^2 (x-2)^3$$

$$\Rightarrow \begin{cases} \lambda = 1 \text{ has alg multi} = 2 \\ \lambda = 2 \text{ has alg multi} = 3. \end{cases}$$

$$A - I \text{ has 1 free variable} \Rightarrow \dim E_1 = 1$$

$$A - 2I \text{ has 2 free variables} \Rightarrow \dim E_2 = 2$$

7. Instead of find the eigenvalue 1,
we find an eigenvector \vec{x} with $x^T M = \lambda x^T$.

Let $\vec{1}^T = [1 \ 1 \ \dots \ 1]$.

By the defn of a stochastic matrix, ~~and~~
any such matrix M has $\vec{1}^T M = \vec{1}^T$.

$$\text{So } \vec{1}^T (M - I) = 0^T$$

$\Rightarrow M - I$ is not invertible

$\Rightarrow \det(M - I) = 0$.

$\Rightarrow 1$ is an eigenvalue.
